

Setting up the Miro App (hosting-side):

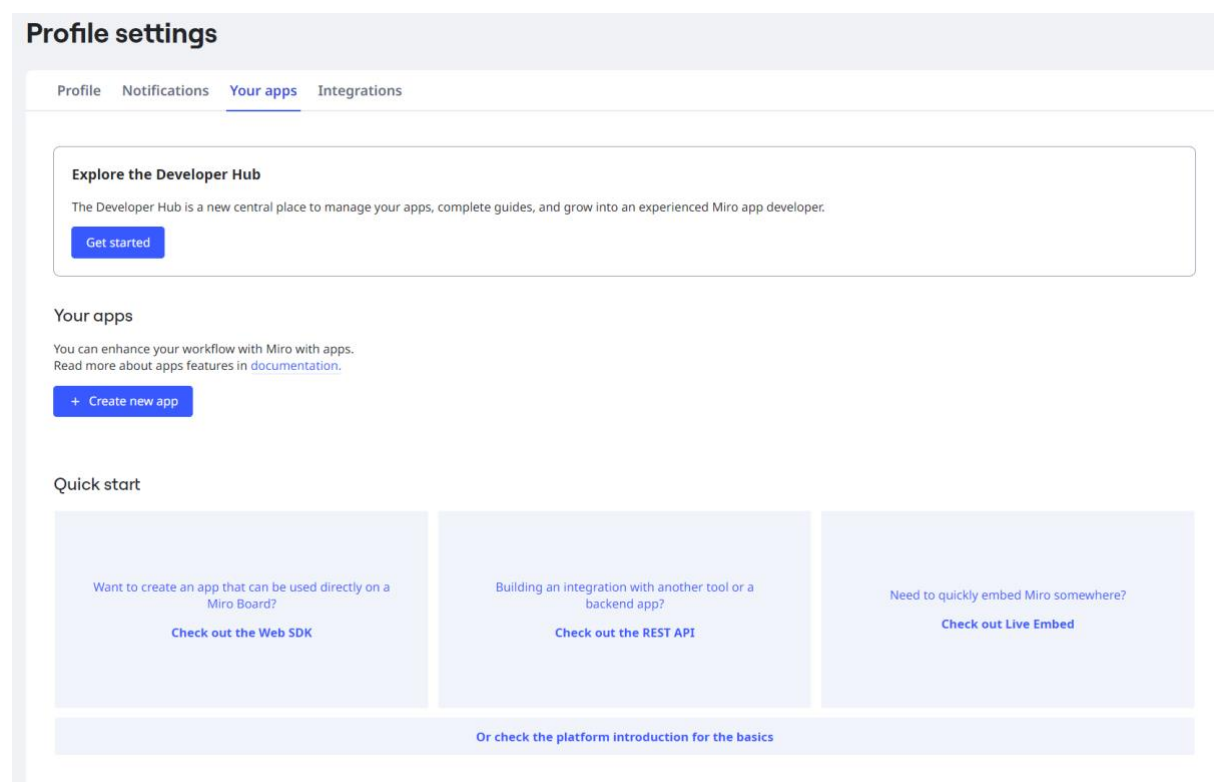

1. Download the GitHub directory folder.
2. Add your OpenAI API token to the backend/openai-proxy.php file.
3. In the overall directory, run the command: **npm install**
4. **npm run start**

This will locally host the Miro application (localhost), for a quick way to test the app globally, create an ngrok endpoint (for free) that points to the port that the app runs on.

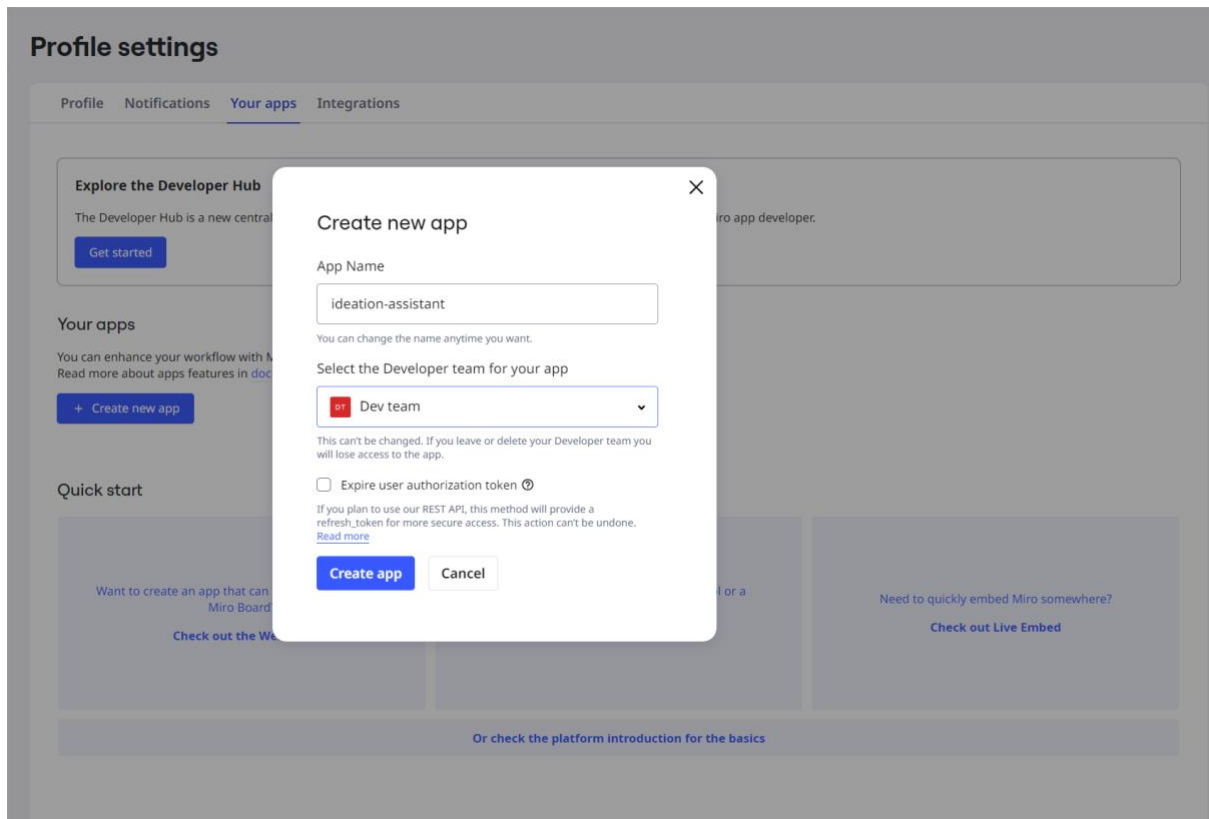

Otherwise, host the application on a server, storing the php file appropriately with the key.

Setting up the Miro App (Web/Miro-side):

1. Go to your Miro account's Apps (also accessible via the Miro API Developer page):

2. Select 'Create new app':
 - a. Give any name.

3. Scroll down and fill in the address that the Miro app is hosted on:

App URL

Required only for Web SDK apps. If you want to enable rendering the app on a board, specify the URL pointing to your app. HTTPS protocol required, except for `http://localhost`.

App URL

Save

Redirect URI for OAuth2.0

Required only for apps that use the REST API. If you want to authenticate your users with OAuth2.0 and connect your server with the Miro REST API, provide a redirect URI. [Learn more](#)

Redirect URI

Add

☐ Expire user authorization token ⓘ

When using a refresh_token method you must provide a working Redirect URI in order to get both refresh and access token.

Permissions

The Miro REST API and the Web SDK implement user access control through scopes. Scopes define the permissions your app requires to interact with a board and to work as designed. When users install your app, they are prompted to provide consent for the required scopes.

All plans

☒	boards:read	Read boards you have access to
☒	boards:write	Modify boards you have access to
☐	identity:read	Read profile information for current user
☐	identity:write	Modify profile information for current user
☐	microphone:listen	Use your microphone

Note that a free way to globally test/host the app is to use an ngrok endpoint that points to your localhost port.

4. At the bottom, copy the Share app link and open in your browser

Submit to the Marketplace

Submit your app to the [Miro Marketplace](#) by filling out our app submission form. We will contact you within 10 business days.

To publish your app on the Miro Marketplace, please fill in the [Partner Interest Form](#).

Share app

You can distribute your app with other Miro users by sharing the app link.

Installation URL

https://miro.com/app-install/?response_type=code&client_id=34587646699643168

Copy

Delete app

If your app is listed in the Miro Marketplace, communicate any plans to deprecate your app to your users, and be prepared to respond to questions and support requests after deleting the app.

Add & allow "ideation-assistant"

Select an organization

Jarod's Space

Select a team

Jarod's Space

This will allow ideation-assistant to:

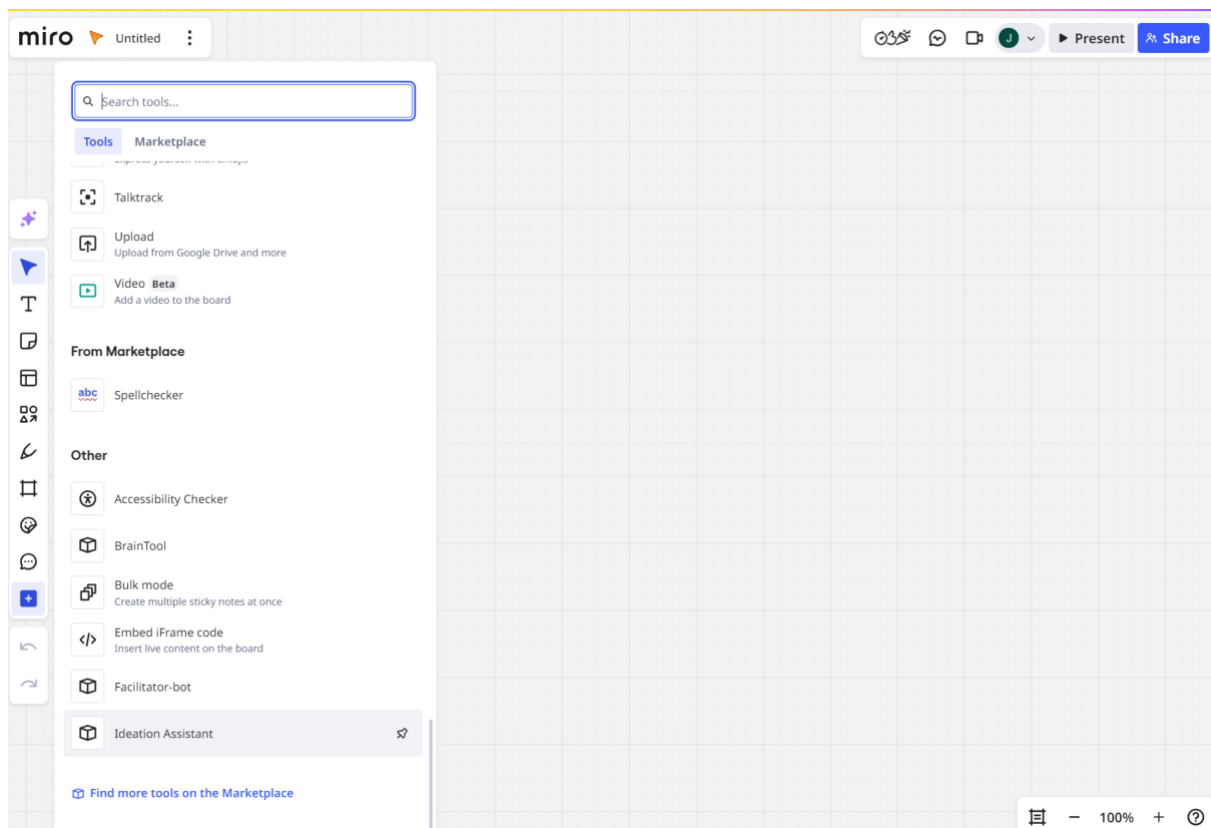

Read and modify boards users have access to

Developed and maintained by external party

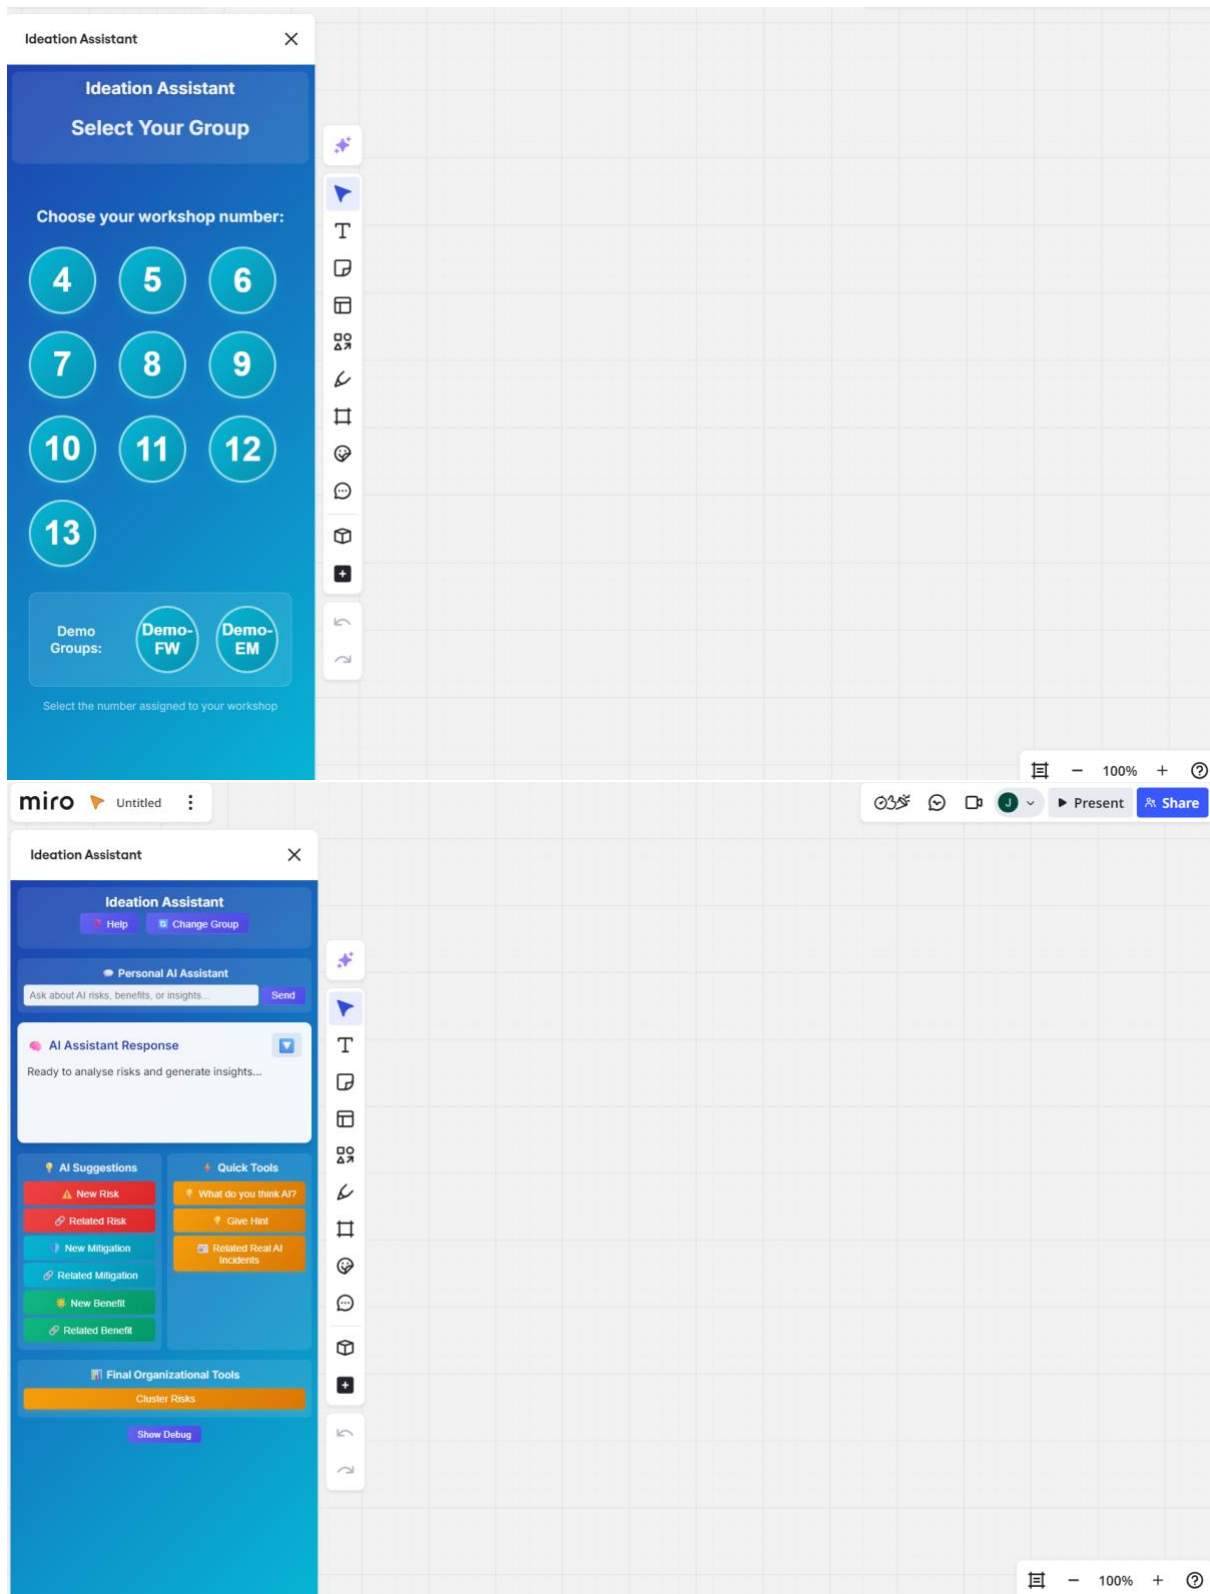

Add

Next: You will be taken to the dashboard

5. Open up a Miro canvas, and click the bottom plus icon ('Tools, Media and Integrations'):

The app should be available to use 😊

Note that if no responses occur (sticky's, prompts etc.), check to ensure that you have provided an OpenAI key. The OpenAI Key should be placed in the backend/openai-proxy.php file.
